Abstract	<p>This study clarified nursing practice and its related factors concerning autonomy of nurses aiming at person centered care for dementia patients among nurses at acute hospitals. A questionnaire survey was administered to nurses belonging to acute hospitals and 248 valid responses were received.</p> <p>Scores on The Self Assessment Scale of Nursing Practice for Elderly Patients with Cognitive Impairment were analyzed with the Aim of Person centered Care in Acute Hospitals as a dependent variable. The [cognitive ability] and [practical ability] subordinate scales of The Scale for Professional Autonomy in nursing were variables that significantly affected scores on The Self-assessment Scale of Nursing Practice for Elderly Patients with Cognitive Impairment. It was suggested that nurses accurately assess the condition of patients with dementia and actively implement care that respects the patients' values and way of life.</p>
keyword	Dementia, acute hospital, person-centered care, autonomy
