Abstract	<p>Interviews on life-story of four aged persons in a nursing home were conducted as a process of narrative based nursing and their effects was analyzed. Three subjects completed interviews and showed positive effects, whereas the remaining one dropped out from interview session because of deteriorated health condition. Interview for each subject was comprised of 12-15 sessions. Positive effects of narrating and hearing of life-stories were 1) recovery of self-esteem by the subjects and making positive attitude for life, 2) increased understanding of others (other aged persons in the nursing home nad and staffs) by subjects, and making better human relations, 3) improved physical health, 4) increased information for staffs and improved nursing services by using such information, and 5) increased understanding of subjects by staffs and improved nursing services with deeper understanding of subjects by staffs. Know-how of narrating and hearing one's life-story as an approach for better nursing must be elaborated.</p>
