Abstract	<p>In this paper, I describe training in psychological assessment using a remote method implemented for a "Psychological Assessment I" course. Handing out two types of materials, i.e., explanatory and fill-in-type, and presenting materials on preceding studies related to the class's content, promoted better understanding in the students. Regarding measures to guarantee reactivity, in classes that adopt an on-demand format by presenting materials and tasks, I showed the need to respond to the students' questions and explain the tasks in detail when providing feedback to such tasks. In class formats that use online conference tools, I showed that employing the Chat feature to answer the students' questions, whenever necessary, promoted their understanding. I also discussed handling psychological tests in remote-style classes, including keeping the test results closed to the general public, such as charts, figures, and related interpretations or hypotheses, and methods of presenting such data.</p>
