Abstract	Smoking among the mentally disabled is high compared to smoking rates in our country. We could not find any survey on smoking restrictions in group homes. Therefore, the purpose of this survey was to understand the current status of smoking restrictions in group homes in the prefecture. Sixty-nine group homes were surveyed. Forty-one homes responded (59.4% response rate), and 41 homes (59.4% valid response rate) were included in the final analysis. The results showed that 80% to 90% of the group homes had some form of smoking restrictions. Six group homes were completely smoke-free, accounting for 15% of the total. Many group homes had restrictions on smoking in living rooms and common areas. Many group homes had outdoor smoking areas.
keyword	Smokers with Mental Disorders Stop smoking
