Title	Analysis of Difficult to Support Cases Presented at Multidisciplinary Case Meetings: Assessment and Strength-Informed Problem-Solving Strategies
Author	Makiko Muroya, Kenji Kuroda et.al
Affiliation	Kansai University
Abstract	<p>We held case study meetings using the incident-process method, in which multidisciplinary professions working in community-based care participated. A content analysis was performed concerning characteristics of cases that the care manager in charge felt difficult to support, assessment by participants of the meetings, and problems and problem-solving proposals that the participants generated at the meeting. This study aimed to make recommendations for the development of care management based on the core values of protecting client's dignity and supporting their independence.</p> <p>The results of the analysis revealed the following points. The difficult to support cases were characterized by several keywords, including "Dementia," "Family Issues," "Medical Treatment," and "Support Issues". Difficulty was not caused by these simple factors but was intertwined due to these factors. It was also affected by cohabiting family members. In the assessment based on the constituent elements of community-based care, there was a paucity of information regarding "the client's wishes" and "informal care support." Further, it was pointed out in the group works that the extracted tasks were insufficient for "grasping personal thoughts" "relationship with the community / support system" and "cooperation". The proposed solution was "to grasp personal thought and strengths," "to build a support system utilizing community care meetings" and "to have a connection with the community".</p> <p>As indicated above, the characteristics of cases where support was difficult were reconfirmed, as was the importance of strengthening the support system from the initial stage and having a system in place to prevent cases becoming difficult to care for. Thus, it is important to adequately understand client and community strengths, evaluate the client's functional capacity, and effectively utilize community information. By practicing these based on the Plan-Do-Check-Action (PDCA) cycle through an interdisciplinary team approach, it is expected that care which supports individuals' dignity and independence will be realized.</p>
keyword	Multidisciplinary Case Meetings, Difficult to Support Cases, Strengths, Care Management, Incident-Process Method
