Abstract	<p>The purpose of this study was to examine the differences in hitting results by batter count in baseball. The general characteristics of the differences were extracted by collecting a large number of batting results, and the universality of the differences was examined by comparing the results between high schools and college baseball players. The number of bases, groundouts, strikeouts, and strikeouts by counts were collected and compared. The number of bases and groundouts clearly differed by batter's count, and the existence of strikeouts and walks were cited as the reason for this difference. It was confirmed that the results of strikeouts and walks were also affected by the count. Since this feature was commonly observed in both high school and college baseball, it was considered to be a common feature that does not depend on generation.</p>
keyword	Baseball, batter count, hitting results.
