Abstract	<p>The purpose of this literature review was to investigate recent initiatives and issues related to Person-Centered Care(PCC) for patients with dementia. We searched the Journal of Health Care and Society using “dementia patients” and “person-centered care” as keywords, and analyzed 21 cases that fit the purpose of this study. As the method of analysis, we categorized initiatives related to PCC for dementia patients according to similarities in content. As a result, four categories and nine subcategories were identified: “Verification of the effects of training targeting PCC providers,” “Verification of the effects of PCC intervention programs,” “Evaluation of PCC provision capabilities,” and “Analysis of factors relating to awareness of PCC providers and the practice of nursing.” It was shown that diverse PCC initiatives were being practiced in recent years. However, we found no programs on the practice of nursing based on PCC, which is offered at acute-care hospitals and whose admissions are expected to increase from now on. Going forward, there is a need for medical and nursing care personnel to cooperate through developing educational programs and offering training in PCC, as well as accumulating professional knowledge on dementia from the perspective of PCC to improve care for patients.</p>
