Abstract	<p>To determine the relationship between self-esteem and the defense mechanisms they use, a self-esteem scale and a defense mechanism measurement scale were administered to 112 college students. Regression analysis revealed that self-esteem had a facilitative influence on mature defense but not on immature defense. However, when factor analysis was used to divide the entire scale into five factors and two items and regression analysis was conducted, it was found that self-esteem had an inhibitory influence on the immature defenses of "transfer of feelings to others" and "escape to fantasy".</p>
keyword	DSQ42, Factor Analysis, Self-Esteem
