Abstract	<p style="text-align: center;">To examine the effect of the player's psychological state on the listeners' psychological and physiological state, 25 people listened to two recordings of "Twinkle, Twinkle, Little Star" played on the piano by one performer who was induced to be in a positive and negative mood, and then measured their mood, blood pressure and pulse rate changes, and impressions of the music. Results showed that when the player was in a positive mood, she played louder and faster, and also led to lower systolic blood pressure and lower depressive anxiety in the listeners.</p>
keyword	piano performance, mood, psychological and physiological state
