Abstract	<p>The purpose of this study was to clarify the concerns about Corona disaster of elderly people living alone or living together with chronic diseases. Internet research was conducted on 208 elderly people living alone and living together with chronic illness. As a result, there were 195 codes of concern in Corona. It was classified into 5 categories: "about COVID-19", "social change", "psychological change", "physical change", and " about daily life". The biggest concern in Corona disaster, both living alone and living together, was the risk of infection, such as "whether I will be infected or not" because I have an illness. Elderly people living together were particularly concerned about infections to their families. Elderly people living alone are expected to have difficulties in daily life such as receiving medical examinations and receiving medicines, and financial and psychological anxiety. Therefore, it is considered necessary to reduce anxiety by supporting regular visits and simulating infections.</p>
