Abstract	The purpose of this study was to clarify the feelings of embarrassment and their influencing factors among nursing students during oral care practice. As an exploratory descriptive study, we conducted a questionnaire survey and analyzed data from 349 nursing students. The results showed that 78.2% of students felt embarrassed about showing their mouths during oral care practice, and the percentage of people who feel embarrassed about showing the inside of their mouths to the opposite sex has risen to 86.5%, meaning many students experienced embarrassment. About 90.8% felt embarrassed about pairing with the opposite sex for oral care practice, which was even higher than the embarrassment of showing their mouths to the opposite sex. As for influencing factors, students with higher self-efficacy regarding career choices tended to feel less embarrassed about showing their mouths during practice. Additionally, 4th-year students were less embarrassed than 1st-year students about showing their mouths to the opposite sex. Men felt less embarrassed than women about pairing with the opposite sex during practice, but since the number of men and women was different and the effect size was small, further verification is needed.
