Title	Functional studies of agricultural products and their application to processed foods
Author	Midori Yasuda
Affiliation	Department of Health and Nutrition Sciences, Nishikyushu University
Abstract	<p>Foods have three functions: nutritional function (primary function), taste and flavor (secondary function), and physical condition regulation (tertiary function). In particular, the tertiary function is attracting attention as it is believed to contribute to disease prevention and health promotion. It has been reported one after another that agricultural products contain distinctive components and exhibit tertiary functions. It is hoped that the functionality of these components will be utilized in processed foods. I have been conducting research on functional components of various agricultural products and developing products utilizing their functionality. Here, I would like to introduce some of them.</p>
keyword	water chestnut, polyphenols, asparagus, Jerusalem artichoke
