Abstract	<p>Child care workers' awareness of risks can prevent serious accidents involving children. It is important for childcare students to learn about risk management. In this study, a questionnaire on "Risk Management in Childcare Centers" was administered to childcare students.</p> <p>The study revealed the following.</p> <p>(i) When considering risk management in childcare centers, it is possible for students to envision accidents based on interactions and communication between children.</p> <p>(ii) The students is able to assume the risk of injuries that occur frequently in children's daily life and play.</p> <p>(iii) The students are able to think about strong allergies, heat stroke, infectious diseases, choking, and prowling that can lead to serious accidents in childcare settings.</p> <p>It was found that childcare students have an overall understanding of the risks inherent in childcare settings, without being biased toward any particular risk. However, it was found that childcare students have difficulty imagining children's crisis situations in concrete terms within the context of practical childcare situations. Their risk management skills are improved when childcare students learn proactively with an awareness of actual childcare settings.</p>
keyword	risk management, childcare accident, safety control
