Abstract	The purpose of this study was to examine theories about health and health education from the viewpoint of health as content to be learned in early childhood, and to provide basic knowledge about future infants and health. Considered mainly from the following points. (1) Health promotion and health education. (2) Literacy and health education. (3) Health education and ethics. (4) Play and health. (5) Exercise and health. (6) Future society -Society5.0- and health. The results of the study were as follows. Health in early childhood was play. The play was not a method, but a mode that gives meaning to the life of the infant. Therefore, it was necessary to consider the power of play for health as personal and social well-being. That leads to the development of health promotion and captures a variety of happiness. It is required discussion and practice from that play point of view the future.
