Abstract	A "convincing solution" is defined as "a provisional solution in which the value being learned is shared by the teacher and the students and among the students and is accepted as something of value to themselves." And I thought that "learning" is the process of going back and forth between individual solutions and overall solutions and having dialogues and forming "convincing solutions" based on commonalities and differences. The effect of ICT was seen as something that made dialogues smoother and visualized for students and teachers. From interviews with students, it was found that the use of jamboard deepened learning and became a tool to encourage collaborative learning through dialogue and was used to improve records.
