Abstract	<p>“This research aims to investigate the "posture" emphasized in the horticultural therapy and to clarify the present condition and its problems. In 2001, revision of the international function classification allowed ICF to be global standard and the importance on environment was re-realized. We perform the horticultural therapy three times a year outside the university.</p> <p>In this activity, we perform the approach to allow the subjects to be aware of five senses with students. However, input of the senses have problems of not only approach but easy-to-work posture. The status of posture may increase or decrease by half the effect of the approach. Then, we investigated the levelness and twist of right-and-left anterior superior iliac spine in the slip off and frontal in the sagittal plane for the present condition of the posture to evaluate the posture. As a result, there were no subjects with ideal alignment seated position. In this survey, it was suggested that we needed to strengthen the information supplement for the subjects' posture and to clarify the criteria of the range in which the posture of not always keeping constant did not affect the activity from the ideal alignment seated position.</p>
keyword	postural, wheelchair, seating, Horticultural therapy
