| Abstract | Aims: The aim of the present study was to investigate social attitudes toward schizophrenia in Japan and China in view of social distance and knowledge of psychiatry, as well as sociocultural aspects. Methods: Two self-rating scales to compare social distance and knowledge regarding schizophrenia in 352 Japanese subjects and 347 Chinese subjects. Results: Total scores of both scales were significantly higher in Japanese subjects than in Chinese subjects. Conclusions: Social distance associated with schizophrenia is large in both Beijing and Fukuoka, but the features of social distance differ between countries. It is important to to determine the features of stigma associated with schizophrenia and develop anti-stigma programs based on trans-cultural considerations. |
