Abstract	<p>This study proposed issues and suggestions regarding the creation of web-based questionnaires using Google Forms, which has seen an increase in the number of researches in the 2020s. The proposals consisted of removing the required response setting, using radio buttons on the psychological scales, and dealing with the feelings of endless vertical scrolling problems associated with this, and making the URL a meaningful term. Other features included a comment after submitting a response, and a setting not to accept responses, which was designed to be respectful to participants and to protect the data collected. It is hoped that by mentioning these points clearly, the awareness of precautions in making a Web-based questionnaire will increase, and discussions on the establishment of standards for methods of surveying in a more participant-centered manner will be deepened.</p>
keyword	Google Forms, Web-Based Questionnaire, Psychological Research
