Abstract	Children with developmental disorders are often highly preoccupied with certain things, and their dietary obsessions lead to dietary behaviors such as extreme unbalanced diet and swallowing of food in bulk. Unbalanced diet are particularly common among them. Most studies on unbalanced diet in children with developmental disorders so far have been surveys of food preferences and coping with them, and the actual intervention studies are rarely found. Therefore, this study focused on " unbalanced diet " in children with developmental disorders and conducted an intervention study to determine whether specific support measures based on the characteristics of each child would lead to an improvement in unbalanced diet. The results of the intervention study suggested that unbalanced diet in children with developmental disorders is likely to be improved by specific support measures tailored to the characteristics of each child.
keyword	Developmental disorders, Unbalanced diet, Food Support
