Abstract	<p>The COVID-19 pandemic has changed lives around the world, forcing Japanese universities and nursing education to take countermeasures. Therefore, we have conducted an interim evaluation of the initiatives taken by the Department of Nursing from February to August 2020. We decided to compile this report because it will serve as a basic reference for future crisis response and because it will allow us to critique the contents from multiple perspectives. The opinions on the COVID-19 ill-effects, including the online remote learning program, are summarized and discussed from five perspectives, with "objectives," "plans and specifics," and "current evaluation" as three items, respectively. In addition, a web-based survey was conducted on students and faculty members regarding online classes. As a result, students indicated that there was a difference in grade level, and although there were some positive opinions, there were many issues such as the lack of achievement in learning and the inability to relate with others. Faculty members tended to have many negative opinions, including undecided opinions, such as the need for effort and the lack of clear visibility of students' learning outcomes.</p>
