Abstract	<p>The purpose of this study is to discuss “complex” (Jung,1973) by using Word Association Test and PAC(Personal Attitude Construct)Analysis. Jung(1973) figured out the way to find “complex” by using WAT. Numerous studies were reported by using WAT. However, this research is a single case study using construct analysis (Personal Attitude Construct Analysis) in which a subject associates words providing for a statistical and descriptive case study.</p> <p>The subject is a 21 year old male student. The procedure is as 6 follows : 1)doing Word Association Test, 2)associating some word with the stimulate word, 3)rating similarity between associated words, 4)cluster analysis based on the similarity, 5)self-interpretation on the result of cluster analysis, 6)comprehensive interpretation.</p> <p>As a result, it is suggested that applying PAC Analysis to Word Association Test has 3 points: 1) a meaning using with Word Association Test and PAC analysis 2) the some changings of emotion in the “complex” narrative, 3) it is though that there is a same thing between a person’s “complex” and the point of which their “multi-dimensional axis” as determined by PAC analysis.</p>
keyword	Word Association Test, PAC(Personal Attitude Construct)Analysis, complex
