Abstract	<p>From the results of mean score of DBD, although the nursing care level has progressed from 1 to a maximum of 5, it can be concluded that the burden of care has not become heavier. There was no tendency for the progression of cognitive impairment in this subject to be faster than in the general AD population, despite the influences of Covid-19. The results indicated that caregiving techniques and active and passive horticultural therapy techniques in Japanese welfare facilities for the elderly are expected to be effective in preventing the progression of cognitive impairment.</p>
