Abstract	In this research, we took an affordance-theoretical approach aimed at reducing dependence on cases in which ADL was impaired due to strong dependence. Intervention using affordance theory in ADL, which was difficult, especially in toilet movements, changing clothes, and walking, reduced dependent remarks and showed an ambitious attitude toward rehabilitation. In addition, her introspection also changed from "I can't do anything" to "I can do this much". An environment setting approach that evaluates the perceptual state of the case, prepares the environment so that the movement of the case can be elicited, and applies the affordance theory that intervenes to make the perceptual system easier to work has led to reduction of dependence and improvement of ADL. It might have been speculated that it.
keyword	Dependence, affordance, environment-setting
