Abstract	<p>This study conducted semi-structured interviews with five mothers and analyzed their verbal content using the Grounded Theory Approach in order to clarify the process of selecting the Dohsa-hou method as a therapy for their child with physical limitations. As a result, nine categories were generated, and it was found that mothers who felt the need for therapy after their child's birth found the significance of the Dohsa-hou method through several experiences of therapy, and then selected it. In addition, it was found that as the child grows up, the desire for therapy changes to include more psychological elements, and a new value of the Dohsa-hou method is found.</p>
keyword	Dohsa-hou method, child with physical limitations, mothers
