Abstract	<p><i>Objectives:</i> To examine research on sex education provided at home by Japanese parents, clarifying the annual changes, age of the target children, research objectives, and level of evidence of the published articles, in order to clarify the direction of future research.</p> <p><i>Methods:</i> We searched articles published in Japana Centra Revuo Medicina and other resources between 1986 and 2015, using the key words “home”, “parents”, and “sex education”. As a result, 62 articles were identified, among which 32 articles were selected for analysis. Tabulation was performed with respect to the annual changes and the age of the target children, while the research objectives were categorized and classified by the level of evidence.</p> <p><i>Results:</i> The number of articles increased after 2001 and the ages of the target children showed a wider range. However, comparative studies or case series (evidence level II) accounted for 90% of the published literature and there were no level I intervention studies. The chief research objectives were “the status of sex education provided by parents” and “the status of children's sexual behavior.” Field studies were mainly employed for research.</p> <p><i>Conclusion:</i> There was a lack of intervention studies that could promote behavioral change to allow parents to provide sex education with more confidence.</p>
keyword	Home, Parents, Sex education
