Abstract	<p>Purpose: The purpose of this study is to explore the behavioral characteristics of caregivers living with vulnerable family members during heavy rain disasters in Japan.</p> <p>Methods: Family caregiver behavioral patterns during heavy rain disasters were investigated systematically. Data were collected through semi-structured interviews with caregivers living with vulnerable family members and analyzed by means of qualitative analysis.</p> <p>Results: The following nine behavioral patterns among caregivers during heavy rain disasters were identified: “having a strong optimism bias”, “influenced by the public administration and mass communication”, “confused by the suffering of the vulnerable ones and hesitating to evacuate”, “having previously experienced a flood disaster evacuation”, “having awareness of flood disaster signs”, “following evacuation guidance”, “following disaster preparedness”, and ‘coordinating with institutions to help vulnerable family members’.</p> <p>Conclusions: The results suggest that caregivers regularly involved in outdoor activities with their vulnerable loved ones are more prepared for evacuation. In addition, the effectiveness of the evacuation also depends on the prior knowledge of heavy rain disasters and on detail understanding of the characteristics of the place where they reside.</p>
keyword	heavy rain disasters, evacuation, vulnerable family members
