Author Masayo HARA, and Kenji KURODA  Affiliation Kansai University    Objective  This study aims to clarify factors affecting the feeling that their work is worthwhile among caseworkers engaged in livelihood protection programs and to identify measures to promote this feeling. [Method] A questionnaire survey was conducted at 10 welfare offices in municipalities. The survey participants were 212 caseworkers, of whom 20 returned questionnaires. Statistical analyses were performed for 17 questionnaires, as the valid response rate was 85.6%. The caseworkers' feelin that their work was worthwhile was evaluated using a five-point scale to obtain the worthwhile work score (WWS). In the statistical analyses, WW was used as the dependent variable, and the relationship between WWS an each independent variable was analyzed using t-test, analysis of variance, an correlation coefficients to identify statistically significant variables. A multipl regression analysis was then conducted using significant independent variables.  [Results] The following variables exhibited a statistically significant relationship to WWS: municipalities, professional qualifications, consultation regarding difficult cases, regular case study meetings, health support score helping relation score, collaboration within the local government, an collaboration with medical and long-term care. The multiple regression analysis using seven variables as independent variables excludin municipalities revealed that health support score, consultation regarding difficult cases, and collaboration within the local government were significantly related to WWS.  [Conclusion] To promote the feeling that their work is worthwhile amon caseworkers, it is important for them to develop an attitude of respect for the health and well-being of their recipients. In addition, job environments that ensure supervision and consultation, and increased collaboration with the relevant government department and facilities are important. toward the improvement of recipients' QOL.	Abstract	work is worthwhile among caseworkers engaged in livelihood protection programs and to identify measures to promote this feeling. [Method] A questionnaire survey was conducted at 10 welfare offices in 3 municipalities. The survey participants were 212 caseworkers, of whom 208 returned questionnaires. Statistical analyses were performed for 178 questionnaires, as the valid response rate was 85.6%. The caseworkers' feeling that their work was worthwhile was evaluated using a five-point scale to obtain the worthwhile work score (WWS). In the statistical analyses, WWS was used as the dependent variable, and the relationship between WWS and each independent variable was analyzed using t-test, analysis of variance, and correlation coefficients to identify statistically significant variables. A multiple regression analysis was then conducted using significant independent variables. [Results] The following variables exhibited a statistically significant relationship to WWS: municipalities, professional qualifications, consultation regarding difficult cases, regular case study meetings, health support score, helping relation score, collaboration within the local government, and collaboration with medical and long-term care. The multiple regression analysis using seven variables as independent variables excluding municipalities revealed that health support score, consultation regarding difficult cases, and collaboration within the local government were significantly related to WWS.  [Conclusion] To promote the feeling that their work is worthwhile among caseworkers, it is important for them to develop an attitude of respect for the health and well-being of their recipients. In addition, job environments that ensure supervision and consultation, and increased collaboration with the relevant government department and facilities are important. Promoting the feeling that their work is worthwhile among caseworkers will also contribute toward the improvement of recipients' QOL.
