Abstract	<p>The aim of this study was to analyze comments provided in our survey on the provision of allergy appropriate food services in residential nurseries and children's care homes, to examine the issues identified, and to compare facilities that used food allergy guidelines with those that did not. The facilities analyzed were 30 residential nurseries and 71 children's care homes where dietitians responded through comments in self-administered questionnaires. Characteristic concerns with children's social care related to problems with food services during an emergency admission due to lack of allergy information at the time of admission. Among dietitians that did not use food allergy guidelines, concerns such as anxiety around the risk of allergy onset were found at residential nurseries, and concerns about appropriate responses to accidents and to children with severe conditions were found among dietitians at children's care homes. Dietitians that did use food allergy guidelines had little concern about using specific menus, but raised the importance of information sharing, having a common understanding, and recognizing differences in food allergy awareness among staff. Dietitians at children's care homes that used food allergy guidelines had few issues with dietary guidance and less need for consideration of children's psychological state, but sought additional information outside of the facilities. As indicated above, comments made by dietitians working at facilities without any food allergy guidelines acknowledged problems in providing adequate menus and dietary guidance. Where guidelines were used, challenges such as information sharing between staff and departments surrounding the children (including cooperation within and outside of facilities), and maintaining relationships with other facilities, were expressed.</p>
