Abstract	<p>Aim: To examine the characteristics of social functions and life-related domains associated with cognitive frailty in community-dwelling older adults.</p> <p>Methods: This study is cross-sectional study. One hundred twenty-one community-dwelling older adults (mean age \pm SD: 77 \pm 7 years) participated. Social functioning was assessed based on the Makizako-5 criteria and life-related domains based on the Kihon Checklist (KCL) questionnaire. Statistical analysis was performed based on binomial logistic regression analysis with the presence of cognitive frailty as the dependent variable.</p> <p>Results: The social functioning and life-related domains associated with cognitive frailty were the Makizako-5 [OR: 0.25 (95%CI: 0.07–0.95)], and oral functioning [4.72 (1.03–21.56)] items. In particular, the characteristics revealed included less frequent visits to friends' homes ($p = 0.035$), lower sense of self-usefulness ($p = 0.011$), and dry mouth ($p = 0.011$).</p> <p>Conclusions: Low social functioning and poor oral function were found to be associated with cognitive frailty.</p>
keyword	Cognitive frailty; social function; Kihon Checklist; oral function; community-dwelling older adults
