Abstract	This study explores the relationship between subjective memory complaints (SMC) and satisfaction with meaningful activities among community-dwelling older adults. The prevalence of SMC was 63.2% (n = 339). Participants with SMC reported lower satisfaction with meaningful activities compared to those without SMC (p = 0.012). Notably, participants who responded positively to SMC-2 (“Do you forget where you have left things more than you used to?”) (p = 0.027) and SMC-4 (“Do other people find you forgetful?”) (p = 0.004) had significantly lower satisfaction with meaningful activities. Logistic regression analyses revealed a significant relationship between SMC and satisfaction with meaningful activities after adjusting for covariates (OR, 0.79; 95% CI, 0.633-0.996; p = 0.046). There is a relationship between SMC and satisfaction with meaningful activities among community-dwelling older adults. Participation in and satisfaction with meaningful activities may play a role in developing effective support for individuals with SMC.
keyword	community based, meaningful activity, older adults, satisfaction, subjective memory complaints
