Abstract	<p>Developmental disabilities, disorders of the neural networks of the brain in childhood, are disabilities whose cause and effect cannot be matched on a one-to-one basis. In terms of how multiple symptoms are related to each other, it has recently been considered that sensory characteristics (sensory hypersensitivity) have an effect on the mind, behavior, body, etc. over time, which also leads to future inactivity in life. We believe that understanding and supporting developmental disabilities as a lifespan disability can be achieved by exploring how to support children during the preschool and school years as a life stage in which their problems come into focus, and especially how to respond to them by understanding their sensory characteristics.</p> <p>Translated with <a href="http://www.DeepL.com/Translator">www.DeepL.com/Translator</a> (free version)</p>
